DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING
UCS1711 - MOBILE APPLICATION DEVELOPMENT LAB
Assignment 1

Name: Jayannthan P T

Dept: CSE 'A'

Roll No.: 205001049

Generate a Health Insurance registration form to register the patient details under each group.

Patient Details

a. Assign a title for the registration form (TextView- textSize, textStyle, typeface)

Group1 Patient Details

b. Patient Name. Specify some font and colour. (use TextView, EditText-standard)

c. Patient Phone Number (Mobile or Landline use Checkbox)

d. Address (use TextView, EditText-standard)

e. Age (TextView, EditText)

f. Date of Birth (DatePicker)

g. Gender (RadioButton)

h. Marital Status (Spinner)

Employer Details

a) Patient Employer

b) Employment Status (full time, parttime, unemployed, retired, student, other Checkbox)

Emergency contact Details

a) Name (EditText)

b) Relationship (EditText)

c) Address (Textarea)

d) Phone Number (EditText- inputType, phoneNumber)

Use Submit (Button) to submit the details and display the contents. Use Reset button to clear the form.

Additional: Display using Table layout create an output window using OPENGGL and to draw the following basic output primitives:

Title of the Program: Generate a Health Insurance registration form to register the patient details under each group

Objective:

The objective of the Health Insurance Android App project is to create a user-friendly application that allows users to input their personal details, employment information, and emergency contact details. The entered data is then displayed in a well-organized manner for the user's review.

Algorithm:

1. Create the main activity layout (**activity_main.xml**) with input fields for patient details, employment information, and emergency contact details.
2. Implement the logic to retrieve user input from the main activity, including handling radio buttons, checkboxes, and date picker.
3. Design the display data activity layout (**activity_display_data.xml**) using a **ScrollView**, **TableLayout**, and **TableRow** structure to display the entered data in a tabular format.
4. Pass the collected data from the main activity to the display data activity using an intent with extras.
5. In the display data activity, retrieve the data from the intent and populate the appropriate **TextView** elements in the layout.

Features used:

1. **EditText** widgets for user input.
2. **RadioGroup** and **RadioButton** widgets for gender selection.
3. **Spinner** widget for selecting marital status.
4. **CheckBox** widgets for selecting multiple options (employment status).
5. **DatePicker** widget for selecting the date of birth.
6. Passing data between activities using intents with extras.

13 14 15 16 17 18 19

20 21 22 23 24 25 26

Result:

The mobile application was completed successfully

Best Practices:

1. Use appropriate variable naming conventions for readability.
2. Implement input validation to ensure data accuracy.
3. Utilize layout resources for UI consistency and responsiveness.
4. Organize the code with comments and logical structure.
5. Implement proper error handling to prevent crashes.

Learning Outcomes:

1. Designing Android user interfaces using XML layouts.
2. Data passing between activities.
3. Handling diverse user input elements (text fields, radio buttons, checkboxes, spinners, date pickers).
4. Creating organized layouts with ScrollView, TableLayout, and TableRow.
5. Enhancing Java coding skills for Android development.
6. Managing user interactions and events.
